

OOP-Continue

Polymorphism

- polymorphism means **many forms**
- in python polymorphism allows object of different classes to be treated as if they were of the same class through a common interface(Like Method with same name)
- Example:
 - consider a **Dog** and a **Cat** can both **Speak()**, but they speak differently

```
class Dog:
def speak(self):
return "Woof!"
class Cat:
def speak(self):
return "Meow!"
```

```
animals = [Dog(),Cat()]
```

```
for animal in animals:
print(animal.speak())
```

Task: Create Polymorphism With Abstraction
